

ASSIGNMENT-21.2

Sanjana Bayya

2303A52019

Batch:38

Lab 21 – Collaborative AI Coding: Pair Programming and Version Control Integration

Task 1 – AI-Assisted Pair Programming

- Use AI to generate an initial program (e.g., a simple To-Do List Manager).
- Ask AI to suggest enhancements (such as error handling, additional features, or refactoring).
- Compare the original and improved versions to understand the role of AI in collaboration.

Prompt:

Generate a simple To-Do List Manager program in Python with basic add, delete, and display features. Then suggest improvements like error handling and additional functionalities.

Code & Output:

```

class TodoListManager:
    def __init__(self):
        self.tasks = []
    def add_task(self, task):
        self.tasks.append({'task': task, 'completed': False})
        print(f"Task '{task}' added.")
    def view_tasks(self):
        if not self.tasks:
            print("No tasks in the list.")
            return
        print("\n--- Your To-Do List ---")
        for i, task in enumerate(self.tasks):
            status = "[DONE]" if task['completed'] else "[PENDING]"
            print(f"{i + 1}. {task['task']} {status}")
        print("-----")
    def mark_task_complete(self, task_index):
        if 0 <= task_index < len(self.tasks):
            self.tasks[task_index]['completed'] = True
            print(f"Task '{self.tasks[task_index]['task']}' marked as complete.")
        else:
            print("Invalid task number.")
def main():
    manager = TodoListManager()
    while True:
        print("\n1. Add Task")
        print("2. View Tasks")
        print("3. Mark Task Complete")
        print("4. Exit")
        choice = input("Enter your choice: ")
        if choice == '1':
            task = input("Enter the task: ")
            manager.add_task(task)
        elif choice == '2':
            manager.view_tasks()
        elif choice == '3':
            try:
                task_num = int(input("Enter the task number to mark as complete: ")) - 1
                manager.mark_task_complete(task_num)
            except ValueError:
                print("Invalid input. Please enter a number.")
        elif choice == '4':
            print("Exiting To-Do List Manager. Goodbye!")
            break
        else:
            print("Invalid choice. Please try again.")
if __name__ == '__main__':
    main()

```

```

..
1. Add Task
2. View Tasks
3. Mark Task Complete
4. Exit
Enter your choice: 1
Enter the task: Add task
Task 'Add task' added.

1. Add Task
2. View Tasks
3. Mark Task Complete
4. Exit
Enter your choice: 2

--- Your To-Do List ---
1. Add task [PENDING]
-----

1. Add Task
2. View Tasks
3. Mark Task Complete
4. Exit
Enter your choice: 3
Enter the task number to mark as complete: 5
Invalid task number.

1. Add Task
2. View Tasks
3. Mark Task Complete
4. Exit
Enter your choice: 4
Exiting To-Do List Manager. Goodbye!

```

Explanation:

This task demonstrates how AI can act as a coding partner by generating an initial solution quickly. The student then interacts with AI to refine the code by adding features such as input validation, file storage, or a user-friendly interface. Comparing both versions helps understand how AI improves code

quality and efficiency. It also highlights collaborative development between human thinking and AI suggestions. This process builds better problem-solving and coding practices.

Task 2 – Version Control Integration

Initialize a Git repository for your project.

Perform the following steps:

- Create and switch to a new branch.
- Add AI-assisted modifications.
- Commit with a meaningful message.
- Merge changes back into the main branch.

Reflect on how version control supports collaborative development with AI assistance.

Prompt:

Guide me through initializing a Git repository, creating a new branch, making changes, committing them, and merging back into the main branch.

Code & Output:

```

# Get the content of the TodoListManager cell directly
# This content needs to be manually copied or retrieved via Colab's API if available
# For this example, I will use the known content of cell 9ef2d407
code_to_save = """class TodoListManager:

* c1ae8e3 (HEAD -> master) Initial commit of To-Do List Manager
```

Explanation:

This task focuses on integrating version control into development using Git. It helps students understand how to manage code changes systematically by working in branches instead of directly modifying the main code. AI can assist by suggesting commands and best practices for commits. Merging changes ensures all updates are combined without conflicts. This reflects real-world collaborative workflows used in software development teams.

Task 3 – AI for Commit Message Generation

- Use AI to generate concise, meaningful commit messages based on the changes made.
- Compare AI-generated messages with human-written ones.
- Discuss how AI can improve documentation and traceability in Git history.

Prompt:

Generate clear and concise Git commit messages based on the code changes made, following best practices.

Code & Output:

```

# Read the current content of todo_list_manager.py
with open('todo_list_manager.py', 'r') as f:
    content = f.read()
# Define the new delete_task method and the updated main function

    f.write(updated_content)
print("todo_list_manager.py updated with 'Delete Task' feature.")

```

```

git add todo_list_manager.py

```

```

# Import the Python SDK
import google.generativeai as genai
# Used to securely store your API key
from google.colab import userdata

# Configure Gemini API
GOOGLE_API_KEY=userdata.get('GOOGLE_API_KEY')
genai.configure(api_key=GOOGLE_API_KEY)

# Initialize the Gemini API
gemini_model = genai.GenerativeModel('gemini-1.5-flash-preview-04-17')

# Get the diff of the staged changes
import subprocess
def get_git_diff_staged():
    try:
        # --staged shows changes between HEAD and index
        # --unified=0 shows only changed lines, no context lines
        result = subprocess.run(['git', 'diff', '--staged', '--unified=0'], capture_output=True, text=True, check=True)
        return result.stdout
    except subprocess.CalledProcessError as e:
        return f"Error getting git diff: {e.stderr}"

current_diff = get_git_diff_staged()
print("---- Staged Changes Diff ----")
print(current_diff)
print("-----")

if "No changes" in current_diff or not current_diff.strip():
    ai_commit_message = "No staged changes found to generate a commit message."
else:
    # Prompt the AI to generate a commit message
    prompt = f"""Given the following git diff, generate a concise and meaningful commit message (max 70 characters for the subject line, followed by an optional body if needed):\n\n{current_diff}\n\nCommit Message:'''

    print("\nGenerating commit message with AI...")
    response = gemini_model.generate_content(prompt)
    ai_commit_message = response.text.strip()
    print(f"AI-Generated Commit Message:\n" + ai_commit_message)

# Store the AI-generated message for the next step
# You might want to refine this message before committing
_ai_generated_commit_message = ai_commit_message

```

```

if '_ai_generated_commit_message' in locals() and _ai_generated_commit_message:
    print(f"Committing with AI-generated message: {_ai_generated_commit_message}")
    !git commit -m "{_ai_generated_commit_message}"
    !git log --oneline --graph
else:
    print("No AI-generated commit message found or it was empty. Please generate one first.")

```

Explanation:

Here, AI is used to automate the process of writing meaningful commit messages. Good commit messages improve readability and make it easier to track project history. By comparing AI-generated messages with human-written ones, students learn what makes a message effective. AI can standardize formatting and ensure clarity. This enhances documentation and improves collaboration in team environments.

Task 4 – Pair Programming Simulation

- Student A writes the initial version of a program.
- Student B, with AI assistance, suggests improvements or adds features.
- Both students collaborate using Git branching and merging to integrate their work.

Prompt:

Simulate pair programming where one developer writes initial code and another improves it with AI suggestions, using Git for collaboration.

Code & Output:

```
def add(x, y):
    return x + y
def subtract(x, y):
    return x - y
def main_calculator():
    print("Select operation:")
    print("1. Add")
    print("2. Subtract")
    while True:
        choice = input("Enter choice(1/2): ")
        if choice in ('1', '2'):
            try:
                num1 = float(input("Enter first number: "))
                num2 = float(input("Enter second number: "))
            except ValueError:
                print("Invalid input. Please enter numbers only.")
                continue
            if choice == '1':
                print(num1, "+", num2, "=", add(num1, num2))
            elif choice == '2':
                print(num1, "-", num2, "=", subtract(num1, num2))
            break
        else:
            print("Invalid input. Please enter 1 or 2.")
if __name__ == '__main__':
    main_calculator()
```

```
... Select operation:
    1. Add
    2. Subtract
Enter choice(1/2): 2
Enter first number: 64
Enter second number: 32
64.0 - 32.0 = 32.0
```

Explanation:

This task mimics real-world pair programming where two developers collaborate on the same project. One focuses on writing the base code, while the other enhances it using AI tools. Git branching allows both contributors to work independently and then merge their work smoothly. This improves teamwork, code quality, and problem-solving skills. It also shows how AI can act as an assistant in collaborative coding environments.
